REPORT BRIEF
ASTROPOWER 40.0 AMPERE-HOUR SEALED SILVER-ZINC SECONDARY SPACECRAFT CELLS

Ref: (a) NASA, Purchase Order W12-397
(b) NASA, ltr BRA/VBK/pad of 25 Sep 1961 w/BUWEPS first and FQ-1:WSK of 2 Oct 1961 to CO NAD Crane

I. TEST ASSIGNMENT BRIEF

A. Silver-zinc, 40 ampere-hour, Astropower cells, with an inorganic separator material, were constructed for NASA, Lewis Research Center, under Contract NAS 3-10928. NAD Crane received 64 of these cells for evaluation on the synchronous and Planetary Earth life-cycling orbits and on a wet-stand test. Prior to the placement of the cells on these programs, all the cells except one, serial number 29, which was dissected, analyzed and photographed so that it may be used as a base reference; were subjected to acceptance tests in which each cell was tested for seal quality, physical defects, and ampere-hour capacity as outlined in the acceptance test procedure furnished by NASA Goddard Space Flight Center (Appendix I). This report covers the acceptance test plan of the evaluation program in compliance with references (a) and (b).

II. RESULTS

A. Leakage was detected in five cells prior to the capacity tests and in 19 cells after the capacity tests.

B. There was only one cell which failed to deliver a capacity of 40.0 ampere-hours (cell serial number 107--39.45 ampere hours). The average ampere-hours out on the first and second charge/discharge cycle were 42.41 and 42.18.

III. COMMENTS

A. NASA Goddard and NASA Lewis were informed that 30 percent of the cells were detected as leakers. They then decided that the top portion of the cells be re-potted at NAD Crane to correct this problem prior to the placement of the cells on the various test programs.

RESULTS OF ACCEPTANCE TESTS OF 40.0 AMPERE-HOUR SEALED SILVER-ZINC SECONDARY SPACECRAFT CELLS MANUFACTURED BY THE ASTROPOWER DIVISION OF MCDONNEL DOUGLAS

I. INTRODUCTION

A. The Astropower Division of McDonnell-Douglas developed an inorganic separator material which they incorporated into the construction of 40.0 ampere-hour silver-zinc cells (one cell is shown in Photograph I). NAD Crane received 64, HS-40-7 Series M type cells, fully formed as reported in the NASA technical report DAC-60989-F of November 1970 prepared by Astropower Laboratory, McDonell Douglas Astronautics Company for evaluation on the synchronous and Planetary Earth life-cycling orbits and on a wet stand test. Prior to the placement of the cells on these programs, all the cells except one; serial number 29, which was dissected, analyzed and photographs so that it may be used as a base reference; were subjected to acceptance tests in which each cell was tested for real quality, physical defects and ampere-hour capacity as outlined in the acceptance test procedure furnished by NASA, Goddard Space Flight Center (Appendix I).

II. TEST CONDITIONS

A. All acceptance tests were performed at an ambient temperature between 23° C and 27° C at existing relative humidity and atmospheric pressure.

III. CAPACITY TESTS

A. The average ampere-hours input/output on the first charge/discharge cycle were 42.63 and 42.41, and on the second charge/discharge cycle they were 42.11 and 42.18. Only one cell (serial number 107) failed to deliver 40.0 ampere-hours during acceptance testing and that was during the second cycle when it delivered 39.45 ampere-hours. These results are listed in Table I.

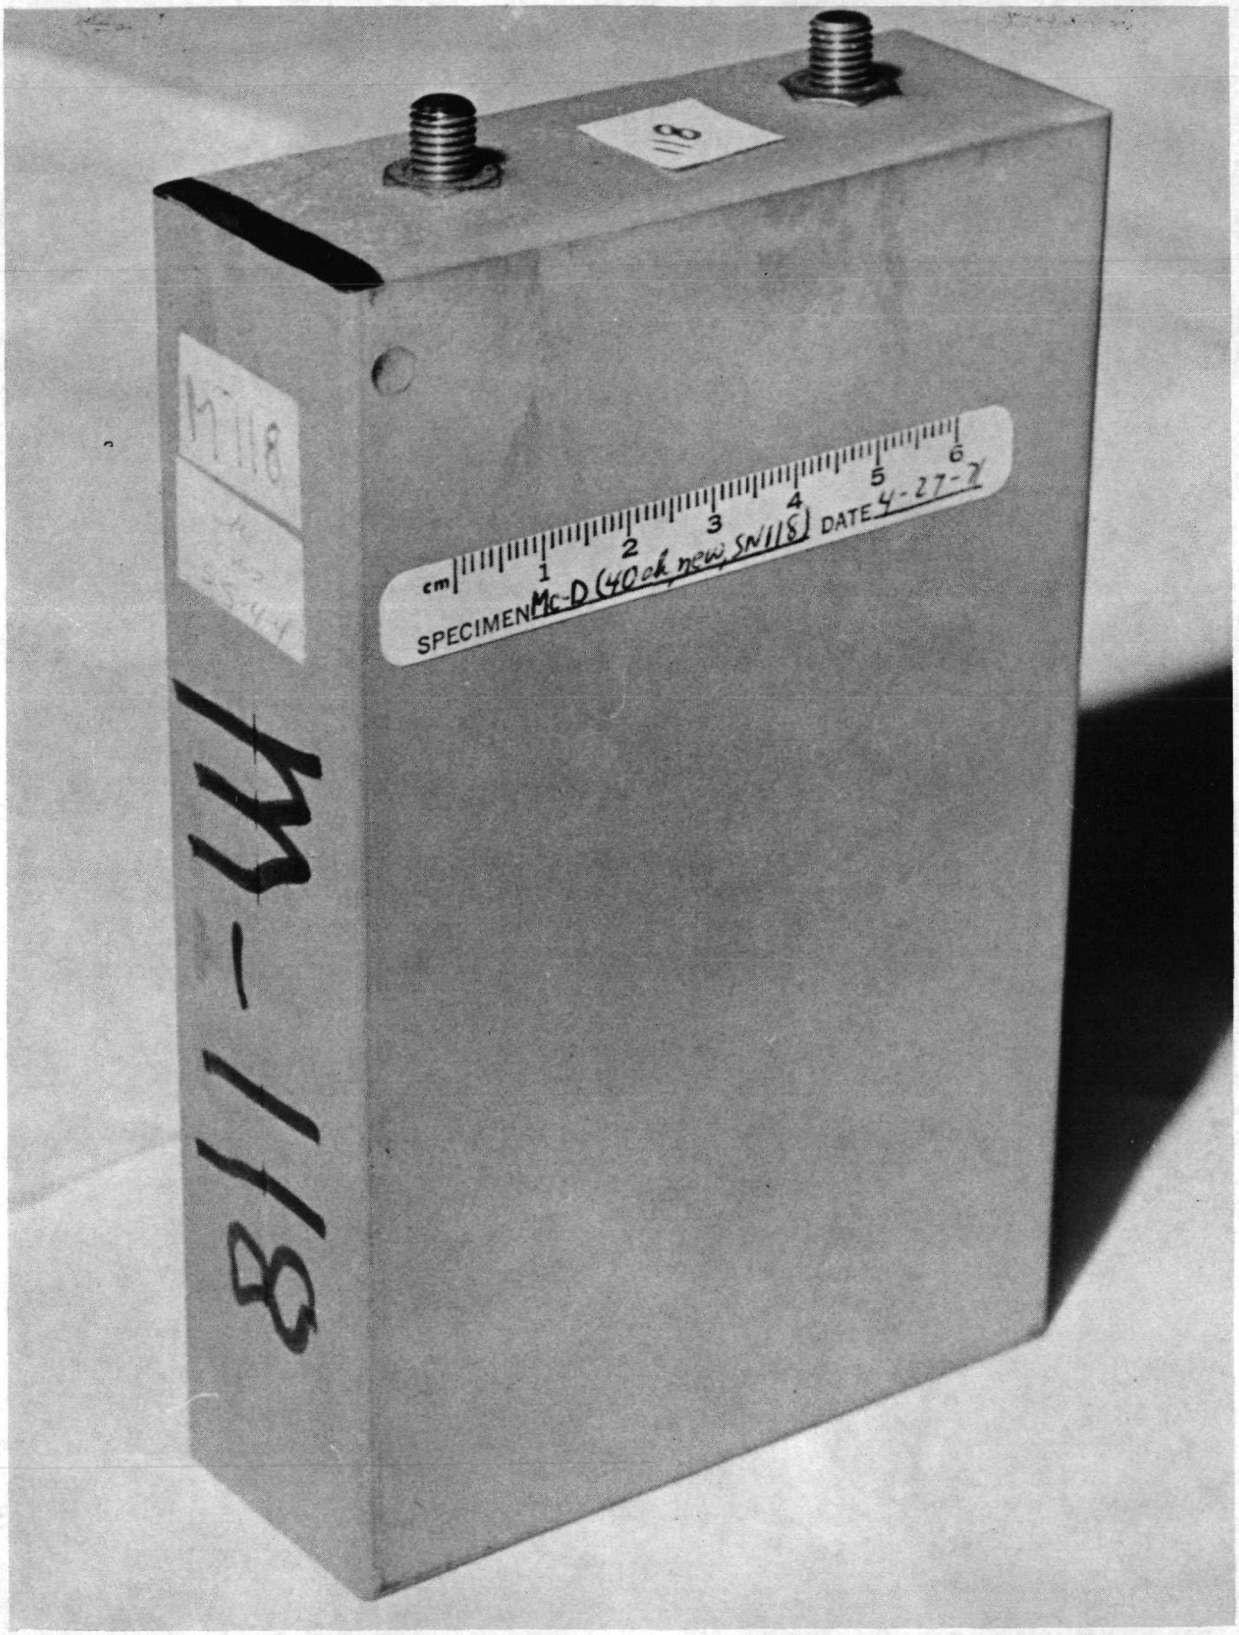
IV. CASE INSPECTION AND LEAK TESTS

A. Visual inspection of the molded plastic case showed no defects before or after capacity tests. Prior to testing, visual inspection showed that five cells had leakage around their terminals and after the capacity tests 19 cells had leaks as detected by phenolphthalein solution. The results of these tests are listed in Table II in which only those cells that leaked are listed.

B. NASA Goddard and NASA Lewis were informed that 30 percent of the cells were detected as leakers. They then decided that the top portion of the cells were to be re-potted at NAD Crane prior to their placement on the various test programs (Photograph No. 2). By re-potting the cells, extension terminals were necessary and the addition of the extension terminals and potting compound increased the height of the cells approximately .500 inch and the weight approximately 58 grams.

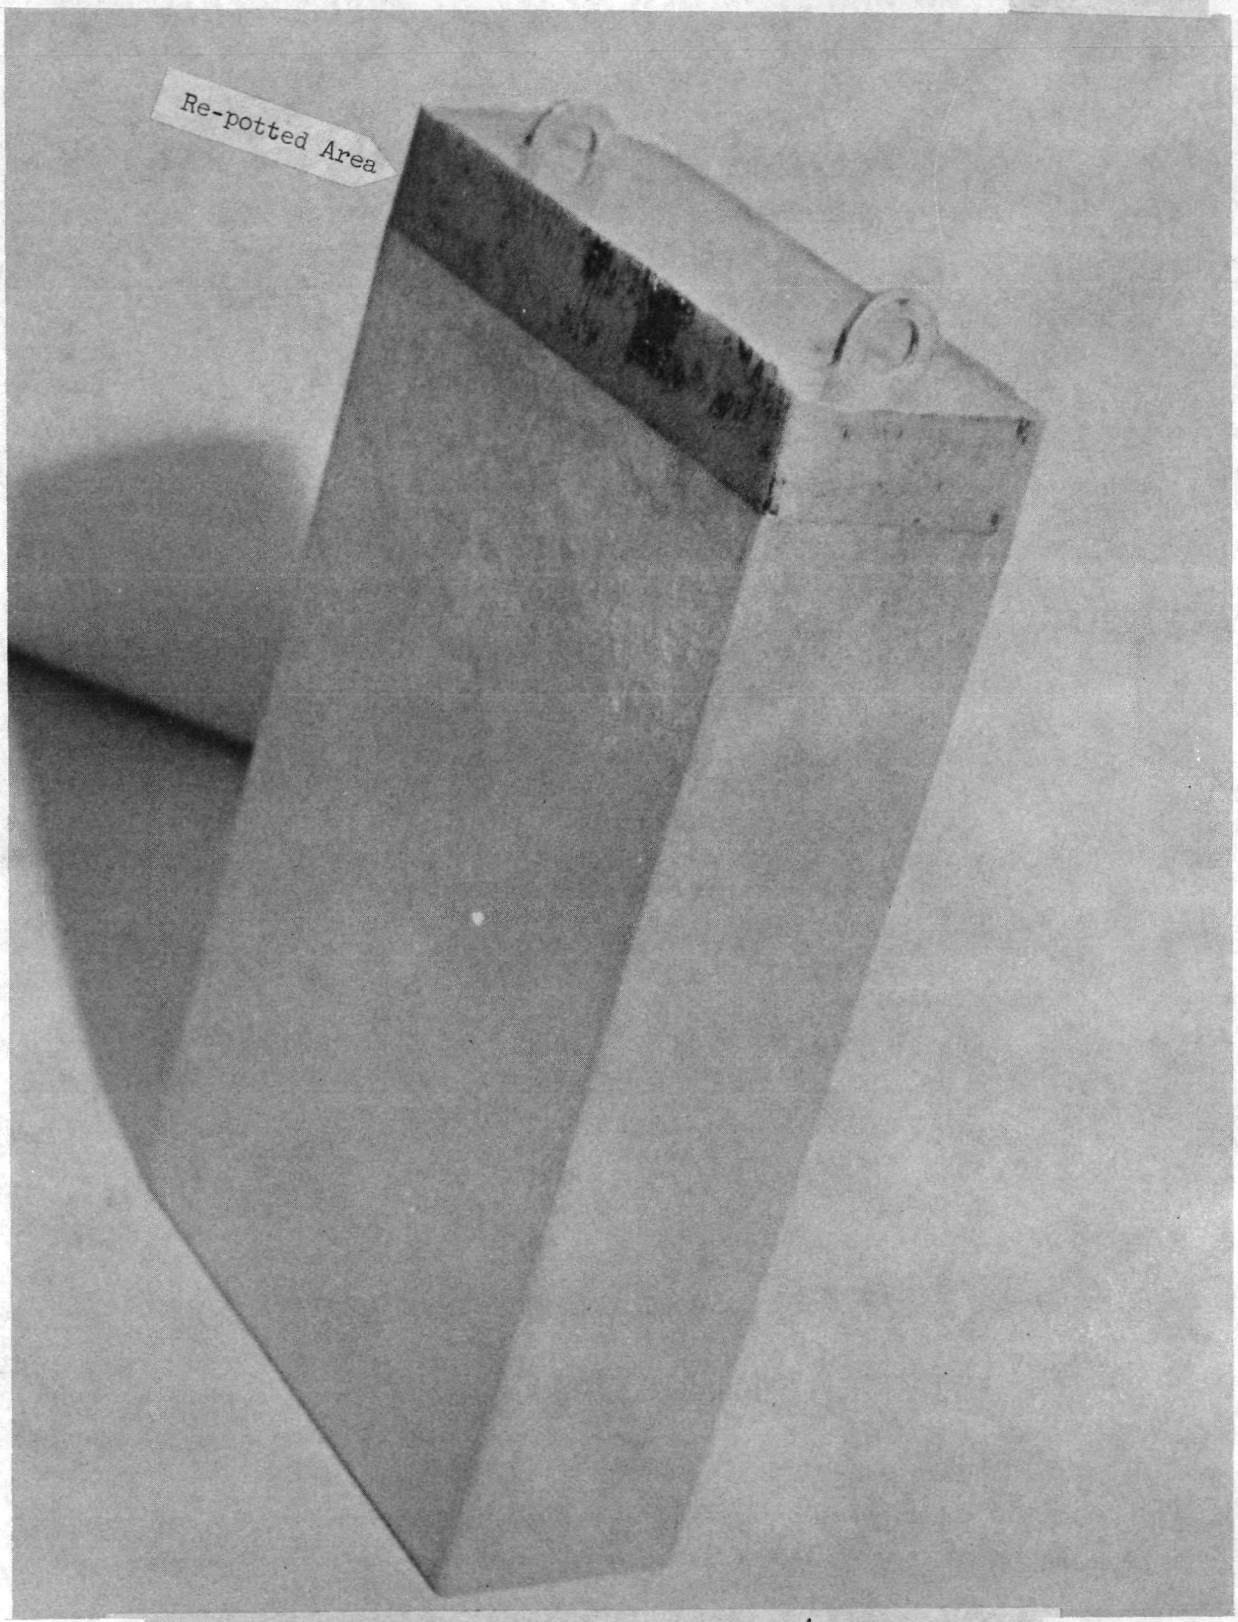
V. PHYSICAL AND WEIGHT MEASURES

A. Each cell was weighed before and after the capacity tests prior to re-potting. The cell dimensions, initial weight, and final weight are recorded in Table III.



Shown here is a new 40 ampere-hour, silver-zinc cell (manufactured by Astropower of McDonnell Douglas) as received, prior to testing at NAD Crane.

PHOTOGRAPH 1



This is a 40 ampere-hour, silver-zinc cell (manufactured by Astropower of McDonnell Douglas) after re-potting upon completion of acceptance testing.

APPENDIX I

ASTROPOWER HS 40-7 Ag Zn CELLS
SERIES (M-)

ACCEPTANCE TESTS ON ALL CELLS:

1. Inspect cell terminals for corrosion or leaks.

2. Inspect cases for cracks or defects.

3. Weigh all cells within 5 grams.

4. Discharge all cells with 0.5 ohms to 1.0 volts.

5. Assemble cells in 10 cell groups with end plates and connecting rods.

6. Charge at 1.5 amperes to 2.00 volts, each cell. Record cell voltages on first minute of charge and every half hour thereafter. Record Ah in.

7. Discharge at 9.0 amperes constant current to 1.0 volts. Record cell voltages during first minute of discharge and 10-minute intervals thereafter. Record Ah out. After 9.0 ampere discharge continue discharge at 3.0 amperes to 1.0 volts. Record total Ah out for the 9.0 and 3.0 ampere discharges.

8. Repeat steps 6 and 7 once.

9. Ampere-hours out at end of second discharge to be greater than 38.0 Ah. If not, cells should not be used for Sync. Orbit or P.E. Orbiter battery tests.

10. Inspect cell terminals for corrosion and leaks.

11. Weigh all cells to within 5 grams.

12. Assemble cells in 10 cell groups with end plates and connecting rods. The 10 cells for each group shall have similar Ah inputs.

13. Repeat step 6 prior to initiating Synchronous Orbit and P.E. Orbiter Battery tests.
